

Blackout Comms Link Buttons

This Blackout Comms link is easy to carry around, and suitable for a mobile link or a base station. Its state is stored entirely on an encrypted SD card.

Links are all designed to work best by running 24/7, although that is not required. This link is equipped with onboard GPS and will securely share location with other trusted devices (location is always encrypted).

Battery Life

You can expect the included 18650 rechargeable battery to last roughly 24-36 hours on one charge, depending on usage. **It is OK to leave the link plugged into power 24/7.**

You can replace the battery by removing the two bolts that hold the case together. The battery is easily accessible after removing the enclosure back.

Link Features

Your link can respond to remote queries for uptime, battery level, reporting nearby devices, and more.

Go to the *Devices* screen in your communicator, select this link, and touch the controller button. Options will vary, depending on your link and firmware version.
